Knowledge Association Analysis and Big Knowledge Graph Construction for Big Data Management and Decision-making.....*Hong Liang and Ma Feicheng*

Healthcare Big Data Driven Knowledge Discovery and Knowledge Service Approach

..... *Yang Shanlin and other authors*

The Structure Design of China Blockchain Carbon Market for the Future Big Data Environment

..... *Ye Qiang, Gao Chaoyue and Jiang Guangxin*

**ABSTRACTS OF SELECTED ARTICLES**

**Understand the Basic Laws of Population Evolution and Promote the Long-term**

**Balanced Development of China's Population**

*Research Group of the Development Research Center of the State Council*

From the population evolution history of 171 countries including China, the population development shows strong characteristics of the times and internal evolution law. The population development is characterized by periodic fluctuation in traditional society, but "inverted U" in modern society. There are essential differences in the impacts on economy and society caused population in different periods. In the early stage, excessive population growth leads to the "Malthusian trap" that per capita income hovers at a low level. After breaking through the constraints of the "Malthusian trap", the huge labor force will be transformed into a demographic dividend to promote the rapid development of economy and society. China's population development has crossed the "Malthusian trap" and entered the state of low birth rate, low mortality and low growth rate as high-income countries. The simulation forecast shows that China's population will continue to accelerate the trend of fewer children and aging in the future. However, as long as we adopt appropriate policies to encourage fertility, stabilize the urban and rural fertility rate at the level of 2019, fully implement the strategy of actively responding to population aging, comply with the basic trend of population development, and optimize and adjust the mode of economic and social development, we can basically realize the long-term balanced development of population.

**Research on the Pathway and Policies for China's Energy and**

**Economy Transformation toward Carbon Neutrality**

*Zhang Xiliang and other authors*

China's energy and economy system needs a profound transition to achieve CO<sub>2</sub> emissions peaking before 2030 and carbon neutrality before 2060. This study analyzes the pathway of transforming China's energy and economy system, quantifies the contribution of major emissions reduction measures in different periods and the required policy interventions, and conducts uncertainty analysis of key characteristic indicators of the energy and economy transformation pathway using modeling tools including the China-in-Global Energy Model (C-GEM). Results show that China should further improve the energy efficiency and reduce GDP energy intensity by 75% in 2060 compared with the level of 2020 to achieve the carbon neutrality. China should continue to promote the transformation of the energy system
